

SmartImgKit Test Article

This is a test HTML document for the HTML to PDF converter. It contains multiple paragraphs of text that should be rendered into a searchable PDF.

Section One: Introduction

The quick brown fox jumps over the lazy dog. This sentence is used to verify text rendering and word wrapping in the generated PDF output.

Another paragraph here. The converter should preserve document structure including headings, paragraphs, and lists.

Section Two: Features

- Text-based, searchable PDF output
- Preserves heading hierarchy (H1 through H6)
- Automatic word wrapping and pagination
- 100 percent browser-based processing

Subsection: Notes

This is a blockquote example. It should be rendered with indentation to distinguish it from regular paragraphs.

Final paragraph. The conversion happens entirely in your browser using jsPDF. No content is uploaded to any server.
